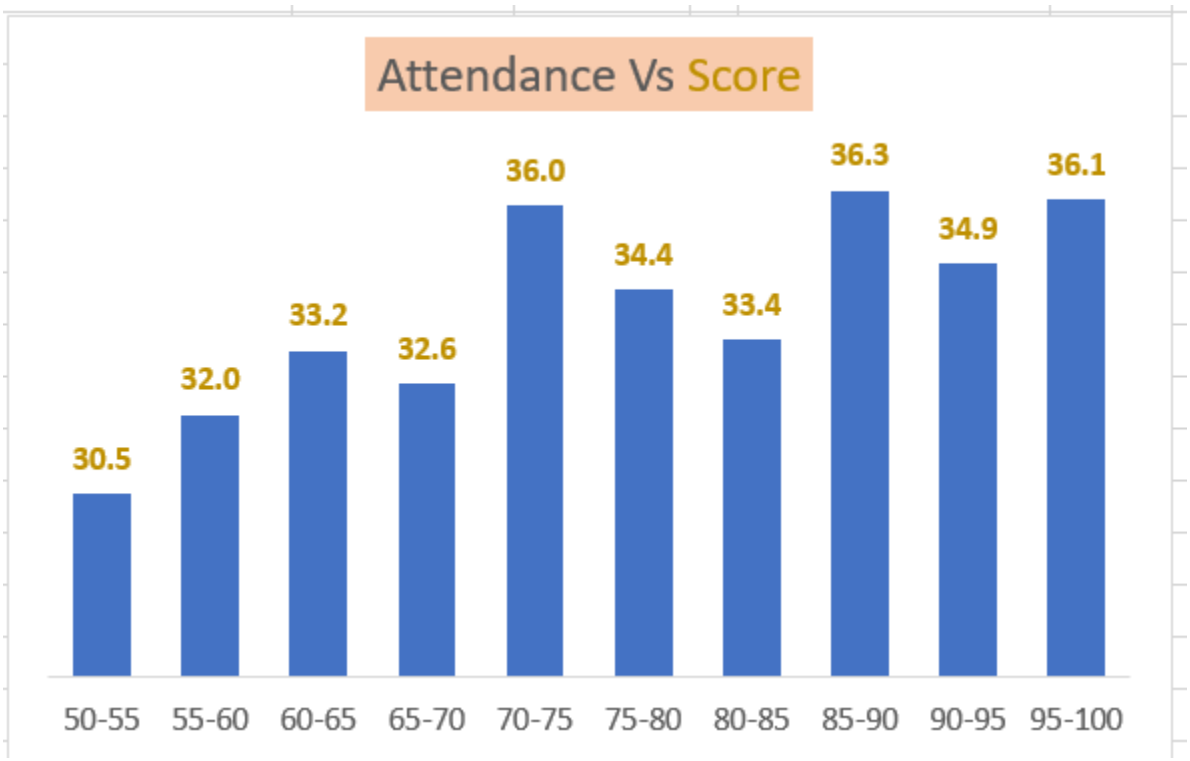
Pivot Table:

Attandence %	Score
50-55	30.5
55-60	32.0
60-65	33.2
65-70	32.6
70-75	36.0
75-80	34.4
80-85	33.4
85-90	36.3
90-95	34.9
95-100	36.1
Grand Total	**34.0**

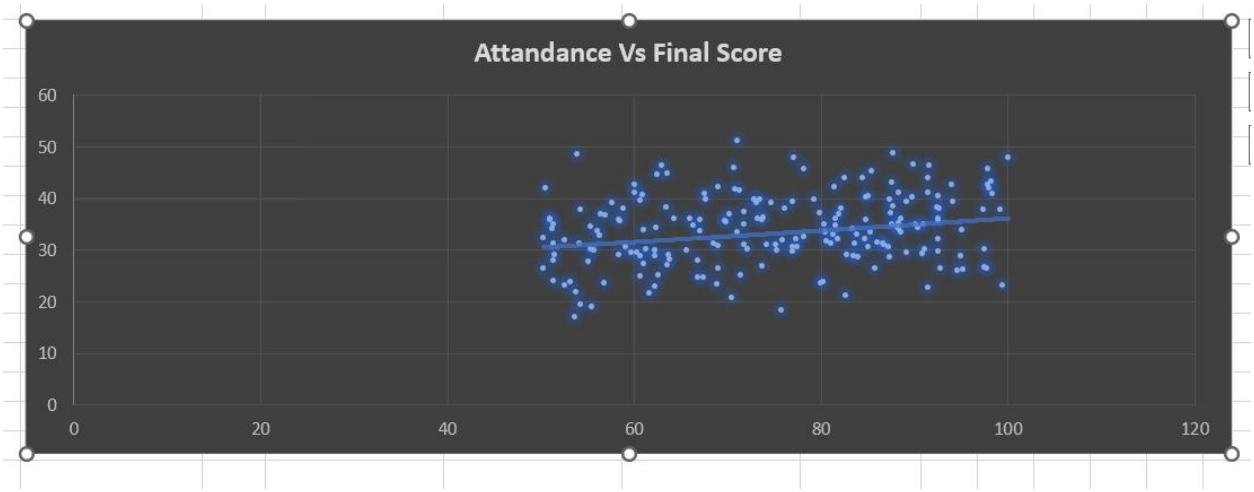
There is 200 data in the dataset so we group the attandace and by that take the average final score on each group

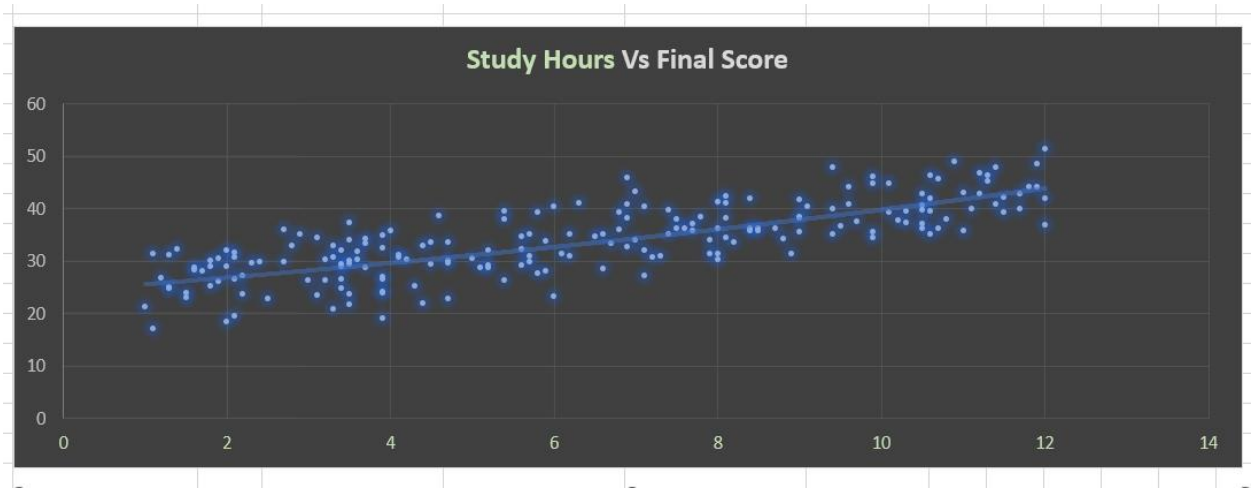
Attadance didn't have much effect on final score .We also analyze it form the chart and scatter plot.

Chart:

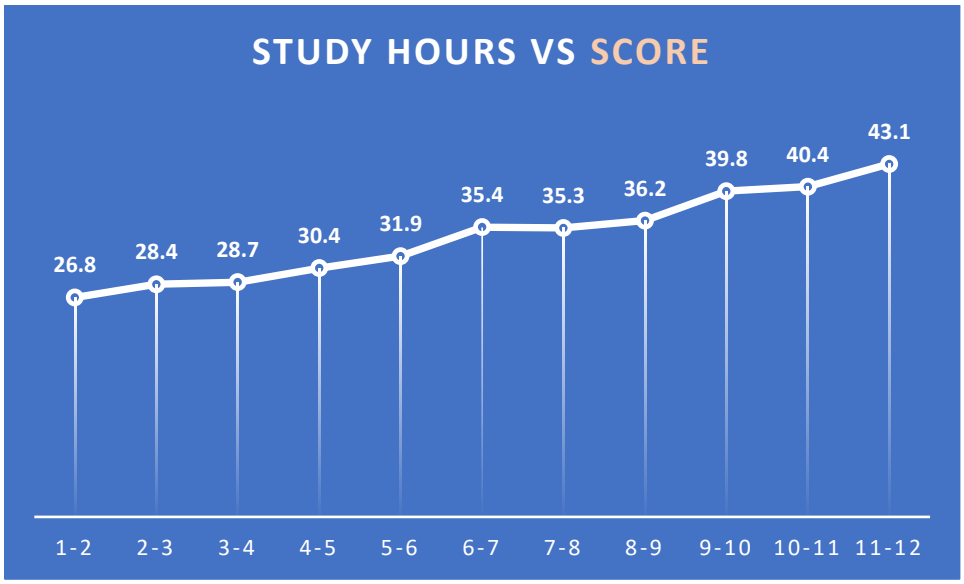


Scatter Plot:





But there is a connection with study hour and final score on average when we take the study hour by group and average final score for each group there is a increase in final score with the increase of study hour.



Conclusion: Students who study more hours generally achieve higher exam scores. By analysing the data, we can see that there is a connection with study hour and final score on average when we take the study hour by group and average final score for each group there is an increase in final score with the increase of study hour.

But Attadance didn't have much effect on final score. We also analyze it form the chart and scatter plot. However, studying more does not always guarantee the highest score because other factors such as sleep and previous academic performance also influence results.
